

INTRODUCING

SC-955

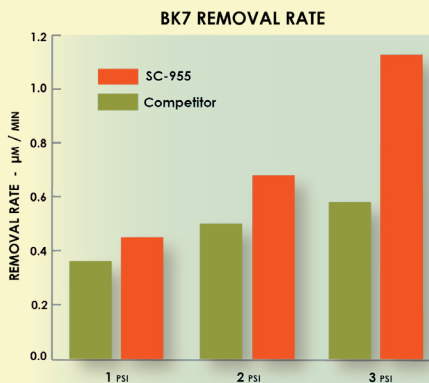

NEXT GENERATION SURFACE REMOVAL

SC-955 is a material of choice for polishing a variety of glass optics where higher removal rates, consistent flatness and an overall good surface finish are required.

Key to SC-955's extraordinary performance is its tightly controlled pore structure. Small and consistent throughout the material's polyurethane architecture, the pores "meter" external polishing or finish slurries while supporting uniform points of contact between the pad and working surface.

SC-955 yields a variety of desired characteristics:

- ✓ **HIGHER surface removal rates**
- ✓ **Consistent batch-to-batch polishing flatness & finish**
- ✓ **Perfect for high pressure applications**
- ✓ **Better PSA adhesion**

✓ **Custom configurations available based on application**
